I. Intro. to Plant Secondary Compounds

A. Examples of secondary metabolites (based on Table 10.3)

Compound	Example Source	Human Use
ALKALOIDS		
Codeine	Opium poppy	Narcotic pain relief; cough suppressant
Nicotine	Tobacco	Narcotic; stimulant
Quinine	Quinine tree	Used to treat malaria; tonic
Cocaine	Coca	Narcotic, tea, anesthetic, stimulant
PHENOLICS		
Lignin	Woody plants	Hardwood furniture & baseball bats
Tannin	Leaves, bark, acorns	Leather tanning, astringents
Salicin	Willows	Aspirin precursor
Tetrahydrocannabinol	Cannabis	Treatment for glaucoma & nausea
TERPENOIDS		
Camphor	Camphor tree	Component of medicinal oils, disinfectants
Menthol	Mints & eucalyptus	Strong aroma; cough medicines

Nicotine's Defensive Function in Nature

Anke Steppuhn, Klaus Gase, Bernd Krock, Rayko Halitschke, Ian T. Baldwin^{*}

Department of Molecular Ecology, Max Planck Institute for Chemical Ecology, Jena, Germany

Plants produce metabolites that directly decrease herbivore performance, and as a consequence, herbivores are selected for resistance to these metabolites. To determine whether these metabolites actually function as defenses requires measuring the performance of plants that are altered only in the production of a certain metabolite. To date, the defensive value of most plant resistance traits has not been demonstrated in nature. We transformed native tobacco (Nicotiana attenuata) with a consensus fragment of its two putrescine N-methyl transferase (pmt) genes in either antisense or inverted-repeat (IRpmt) orientations. Only the latter reduced (by greater than 95%) constitutive and inducible nicotine. With D_4 -nicotinic acid (NA), we demonstrate that silencing pmt inhibits nicotine production, while the excess NA dimerizes to form anatabine. Larvae of the nicotine-adapted herbivore M and M in the excess M and M in the excess M in the ex

Introduction

Plants produce many secondary metabolites, of which some

putative defense trait should be determined in plants differing only in a single gene that controls the expression of a resistance trait and are otherwise identical (Bergelson and

Steppuhn et al. 2004. PLoS Biology 2: 1074-1080.

B. Ecological role of secondary metabolites.

Nicotine negatively affects function of herbivores.

You can't always get what you want, but if you try some time, you just might find, you get what you need. . . Mick Jagger

Unfortunately, a comprehensive understanding of internal processes is not sufficient to test the cost-benefit paradigm, because Darwinian fitness can also be influenced by processes external to the plant (Fig.

B. Ecological role of secondary metabolites.

Plant Compounds are Diuretics to Desert Herbivores

by Denise Dearing, Antonio Mangione and William Karasov

Many plant compounds are recognized deterrents and toxins to a variety of herbivores. The effect of such compounds on water balance of herbivores is virtually unexplored, yet many plant compounds cause diuresis by elevaling urine production and decreasing urine concentration. Caffeine from coffee and black tea is probably the most familiar diuretic agent from plants. However, caffeine is not exceptional.

Ecological role of alkaloids

Nitrogen availability is a major limiting factor in plant growth.

Nitrogen Limitation Restricts CO₂ Absorption by Trees

New research suggests that trees may not be able to limit climate change by storing rising atmospheric CO_2 as was previously believed. Limited availability of nitrogen in the soil, which will become more common as atmospheric CO_2 levels rise, may inhibit plant growth, which in turn would affect plants' accumulation of atmospheric CO_2 . Atmospheric CO_2 levels may therefore rise even faster than anticipated.

caffeine

- •Excess (1 g; 10 cups) can cause anxiety, headache, dizziness, insomnia, heart palpitations, delirium, 4% lower birth weights.
- •Ranks as most widely used psychoactive drug worldwide (coffee, tea, additives to soft drinks)

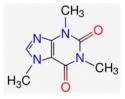

Caffeine's effects on CNS

How?

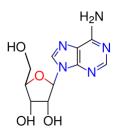

Antagonist of adenosine.

Adenosine:

- · Attaches to brain cell receptors.
- · Neurotransmitter inhibitor.
- Promotes sleep (accumulates in brain each waking hour).
- Suppresses arousal.

Caffeine and Parkinson's prevention?

What is Parkinson's Disease?

Journal of the American Medical Association, March 24, 2000

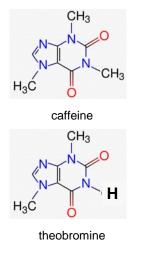

- •afflicts ca. 1-1.5 million people in the U.S., mostly 60 years +
- •no known cause and no cure, just treatments
- •symptoms of trembling arms and legs, trouble speaking, and difficulty coordinating movement
- •neuron degeneration in spec. part of brain
- •many of these neurons contained the neurotransmitter dopamine
- •dopamine levels fall, and the balance between dopamine and other neurotransmitters disrupted, affecting muscular control

Caffeine and Parkinson's prevention? Honolulu Heart Program study of 8,000+ men over 30? 28 oz/day 20-24 oz/day 12-16 oz/day 4-8 oz/day Nondrinker 0 2 4 6 8 10 12 Incidence Rate (#/10,000 person-years) Mechanism: When adenosine receptors are blocked, dopamine levels increase.

<u>Caffeine and Theobromine are similar in structure and action</u>

Table 1. Stimulant alkaloids in world's major stimulating beverages (Simpson 1986). Given in % weight. Amt. in particular beverage depends on how it is made.

Plant, part	Caffeine	Theobromine
Coffee, unroasted, dried seeds	1-1.5	
tea, dried lvs.	2.5-4.5	
Cacao, dried or fresh seeds	0.6-0.8	1.7-2.4
Kola, fresh seeds	2.0	
Guarana, dried fruit	3.0-4.5

Coffee timeline

- 1. First brewed in Yemen 13-14 century (hence, Coffea arabica).
- 2. Arabia to Egypt by 1510.
- 3. To Italy & Europe by 1616.
- 4. Vienna priests threatened by "coffee culture", but Pope Clement VIII would not ban coffee.
- 5. To England by 1650 and coffee houses became important sociopolitico institutions.
- 6. Europe looked to break Arabian monopoly on production. (*Arabians killed embryos in seeds before export*).
